hGDMLP-1; heart;

```
The present invention describes a human genome-derived myosin-like protein 1 (hcDMLP-1). The protein and polynucleotide sequences of hcDMLP-1 uncleic acids can be used as probes to detect, characterise and quantify hcDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hcDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hcDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hcDMLP-1 used as immunogens to raise antibodies that specifically recognise hcDMLP-1 and/or amount specifically of hcDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser description ionisation, as therefore, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production associated with the expression of hcDMLP-1, in particular heart cand skeletal muscle disorders. hcDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the present sequence in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed consideration, but was obtained in electronic format directly from WIPO at figure 1.

Also included are test kits for enabling BRCA1 or hMLH1 gene testing comprising short PCR primers given in the specification, mixed in 20 mM of Tris-HC1, 50 mM KC1, 25 micro M of dNTP, and 5 % formamide. The method is useful for detecting mutations in the BRCA1 (breast and ovarian cancer susceptibility gene, a tumour suppressor gene) and hMLH1 gene (a DNA mismatch repair gene). The present sequence is a PCR primer specific to hMLH1 used in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Detecting mutations in the BRCA1 and hMLH1 gene comprises subjecting amplification products to 2-dimensional gel electrophoresis to produce a characteristic spot pattern for a specific mutation in either the BRCA1 or the hMLH1 gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Vijg
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           breast and ovarian cancer susceptibility gene; TGDS; human; two-dimensional DNA electrophoresis; tumour suppressor gene;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human MLH1 DNA mismatch repair gene,

                                                                                                                                                                                                                                                                                                                                 The present invention describes an isolated nucleic acid (I) encoding a human UDP-GalNAc:polypeptide N-acetylgalactosaminyltransferase 10 (pp-GaNTase 10, EC 2.4.1.41) protein. Human pp-GaNTase 10 is located to chromosome 7q11.2. (I) can be used in gene therapy. Molecules of the present invention can be used in therapy, particularly to prevent or treat a disorder associated with decreased expression or activity of pg GaNTase. The sequences given in ABV85011 to ABV8669 and ABP53502 to ABP53504 are given in the exemplification of the present invention. N.1 The sequence data for this patent is not represented in the printed specification but is based on sequence information supplied by the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                30-JAN-2001;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          25-JAN-2002;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    25-SEP-2002
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            EP1243660-A2

                                                                                                   human UDP-GalNAc:polypeptide N-acetylgalactosaminyltransferase 10 (pp-GaNTase 10, EC 2.4.1.41) protein. Human pp-GaNTase 10 is located to chromosome 7q11.2. (I) can be used in gene therapy. Molecules of the present invention can be used in therapy, particularly to prevent or treat a disorder associated with decreased expression or activity of pp-GaNTase. The sequences given in ABV85011 to ABV86899 and ABP53502 to ABPS5304 are given in the exemplification of the present invention. N.B. The sequence data for this patent is not represented in the printed specification but is based on sequence information supplied by the

                                                                                                                                                                                                                                        The invention relates to an oligonucleotide for targeted alteration of a genetic sequence, which comprises a single-stranded oligonucleotide CC having a DNA domain. The DNA domain has at least one mismatch with CC respect to the genetic sequence to be altered and further comprises CC consist of o-methyl modification, an INA modification, two or more photophorothioate linkages on a terminus, or a combination of any two or CC directing repair or alteration of plant genetic information. The cligonucleotides are useful for CC disconverses, e.g. environmental or abiotic stress tolerance, improved CC phenotypes, e.g. environmental or abiotic stress tolerance, improved CC phenotypes, e.g. environmental or abiotic stress tolerance, improved CC conferring amino acid over production), herbicide resistance (e.g. CC glyphosate resistance, imidazolinone and sulphonylurea herbicide (e.g. increased starch or production of waxy starch), altered floral CC e.g. increased starch or production of waxy starch), altered floral CC e.g. reduced palmitate, increased starate or reduced linolenic acid). CC analysis of photosynthetic processes. This sequence represents a genome CC altering oligonucleotide of the invention
                                                                                                                                                                     Matches

Kmiec EB, Gamper HB, Rice MC,

New oligonucleotides with modified nuclease-resistant termini, useful for creating plants with desired phenotypes, e.g. stress tolerance, improved nutritional value, herbicide or disease resistance, or modified oil production.

Claim 7; Page 80; 220pp; English.

The invention relates to an oligonucleotide for targeted alteration of a genetic sequence, which comprises a single-stranded oligonucleotide CC having a DNA domain. The DNA domain has at least one mismatch with CC respect to the genetic sequence to be altered and further comprises CC chemical modifications of the oligonucleotide. The chemical modifications CC consist of o-methyl modification, an LNA modification, two or more phosphorothicate linkages on a terminus, or a combination of any two or CC directing repair or alteration of plant genetic information. The coligonucleotides are useful for CC directing repair or alteration of plant genetic information. The CC oligonucleotides are particularly useful for creating plants with desired CC phenotypes, e.g. environmental or abiotic stress tolerance, improved CC mutritional value (e.g. altering amino acid content of plants or CC conferring amino acid over production), herbicide resistance (e.g. CC glyphosate resistance, imidazolinone and sulphomylurea herbicide glyphosate resistance, imidazolinone and sulphomylurea herbicide corphology (e.g. male-sterile plants) or modified starch production (e.g. increased starch or production of waxy starch), altered floral CC (e.g. increased starch or production of waxy starch), altered floral CC (e.g. reduced palmitate, increased starate or reduced linolenic acid). CT he oligonucleotides are also useful for producing albino mutants for the canalysis of photosynthetic processes. This sequence represents a genome attering oligonucleotide of the invention

WPI; 2002-106307/14.

New oligonucleotides with modified nuclease-resistant termini, useful creating plants with desired phenotypes, e.g. stress tolerance, impronutritional value, herbicide or disease resistance, or modified oil improved

Claim 7; Page 79; 220pp; English

genetic sequence, which comprises a single-stranded oligonucleotide having a DNA domain. The DNA domain has at least one mismatch with respect to the genetic sequence to be altered and further comprises chemical modifications of the oligonucleotide. The chemical modification consist of o-methyl modification, an LNA modification, two or more phosphorothioate linkages on a terminus, or a combination of any two more of these modifications. The oligonucleotides are particularly useful for creating plants with dephenotypes, e.g. environmental or abiotic stress tolerance, improved The invention relates to an oligonucleotide for targeted alteration modifications t w0 desired Ç, မ္ပ ρι

(e.g. reduced palmitate, increased stearate or reduced linolenic acid). The oligonucleotides are also useful for producing albino mutants for the analysis of photosynthetic processes. This sequence represents a genome altering oligonucleotide of the invention
                                                                              The present invention provides a method of identifying or quant microorganism in a sample by detecting its nucleotide sequence amongst homologous sequences. The method can be used to detect microorganisms and polymorphisms, and to diagnosis genetic dissincluding cancer. The present sequence is a PCR primer used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 17 BP; 3
                                                                                                                                                                                                                                                                                                              Identifying or quantifying organisms or genes, useful e.g. for diagnosis, by detecting specific nucleotide sequences present among several homologous sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Remacle J, | Alexandre I,

CC protein (HTPL, see ABV78759 to ABV78750 to Expansion of the single base pair changes introduces a premature stop codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL CC shared structural features organisation with the Patched protein. The shared structural features strongly imply that HTPL plays a role similar code of the structural features strongly imply that HTPL plays a role similar to that of Patched, and is a potential tumour suppressor. HTPL gene was composed to human chromosome 10pl2.1. HTPL and its coding sequence are useful for diagnosing a disorder caused by mutation in HTPL, and in cc useful for diagnosing a disorder caused by mutation in HTPL, and in charagy and manufacture of a medicament for treatment or prevention of such disorder associated with decreased expression or activity of human chromosome 10ple. Such disorders include disorders of testis, or adrenal, adult and coetal liver, bone marrow, brain, kidney, lung, placenta, prostate, compared to the prostate of the standard coetal liver, bone marrow, brain, kidney, lung, placenta, prostate, coetal liver, bone marrow, brain, kidney, lung, placenta, prostate, coetal liver, bone marrow, brain, kidney, lung, placenta, prostate, coetal liver, bone marrow, brain, kidney, lung, placenta, prostate, coetal liver, bone marrow, brain, kidney, lung, placenta, prostate, coetal liver, bone marrow, brain, kidney, lung, placenta, prostate, coetal liver, bone marrow, brain, kidney, lung, placenta, prostate, coetal liver, bone marrow, brain, kidney, lung, placenta, prostate, coetal liver, bone marrow, brain, kidney, lung, placenta, prostate, coetal liver, bone marrow, brain, kidney, lung, placenta, prostate, coetal liver, bone marrow, brain, kidney, lung, placenta, prostate, coetal liver, bone marrow, brain, kidney, lung, placenta, prostate, coetal liver, bone marrow, brain, kidney, lung, placenta, pr

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        RESULT 1054
ABV78970/c
                          The present invention relates to human testis expressed Patched like protein (HTPL, see ABV/8759 to ABV/8762 and ABB98519 to ABB98520). HTPL has two isoforms, with a few single base pair differences between the two. One of the single base pair changes introduces a premature stop codon in HTPL-S (S for short) compared to HTPL-I (L for long). HTPL shared structural structure organisation with the Patched protein. The shared structural features strongly imply that HTPL plays a role similar to that of Patched, and is a potential tumour suppressor. HTPL is important in regulating male germ cell development, and the HTPL gene was mapped to human chromosome 10pl2.1. HTPL and its coding sequence are useful for diagnosing a disorder caused by mutation in HTPL, and in therapy and manufacture of a medicament for treatment or prevention of such disorder associated with decreased expression or activity of human (FPL, Such disorders include disorders of testis, or adrenal, adult and foetal liver, bone marrow, brain, kidney, lung, placenta, prostate, seletal muscle or colon function. HTPL proteins and nucleic acids are clinically useful diagnostic markers and potenial therapeutic agents for male infertility and cancer. The present oligonucleotide was used in an example from the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Best
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                30-JAN-2001; 2001WO-US000663.

                  The present invention relates to human testis expressed Patched like CC protein (HTPL, see ABY78759 to ABV78762 and ABB8519 to ABB98520). HTPL CC has two isoforms, with a few single base pair differences between the CC two. One of the single base pair changes introduces a premature stop codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL CC shared structural features strongly imply that HTPL plays a role similar to that of Patched, and is a potential tumour suppressor. HTPL is climportant in regulating male germ cell development, and the HTPL gene was CC imported to human chromosome 10912.1. HTPL and its coding sequence are CC useful for diagnosing a disorder caused by mutation in HTPL, and in CC tharapy and manufacture of a medicament for treatment or prevention of such disorder associated with decreased expression or activity of human CC shelal hiver, bone marrow, brain, kidney, lung, placenta, prostate, considerabil useful diagnostic markers and potenial therapeutic agents for male infertility and cancer. The present oligonuclectide was used in an analysis of the considerable was used in an activity of the considerability useful diagnostic markers and potenial therapeutic agents for male infertility and cancer. The present oligonuclectide was used in an activity of the considerability and cancer. The present oligonuclectide was used in an activity of the considerability and cancer. The present oligonuclectide was used in an activity of the considerability and cancer. The present oligonuclectide was used in an activity of the considerable was used in an activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

The present invention relates to human testis expressed Patched like protein (HTPL, see ABV8875) to ABV878762 and ABB98519 to ABB98520). HTPL chas two isoforms, with a few single base pair differences between the cyto. One of the single base pair changes introduces a premature stop codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL cytoshares an overall structure organisation with the Patched protein. The shared structural features strongly imply that HTPL plays a role similar cytoshared to human chromosome lopic.1. HTPL and its coding sequence are mapped to human chromosome lopic.1. HTPL and its coding sequence are comportant in regulating male germ cell development, and the HTPL gene was composed to human chromosome lopic.1. HTPL and its coding sequence are composed to human chromosome lopic.1. HTPL and its coding sequence are composed to human chromosome lopic.1. HTPL and its coding sequence are composed to human chromosome lopic.1. HTPL and its coding sequence are composed to human chromosome lopic.1. HTPL and its coding sequence are composed to human chromosome lopic.1. HTPL and its coding sequence are composed to human chromosome lopic.1. HTPL and its coding sequence are composed to human chromosome lopic.1. HTPL and its coding sequence are composed to human code disorder caused by mutation in HTPL, and in characterial and coding sequence code sequences or colon fundament for treatment or prevention of such disorders include disorders of testis, or adramal, adult and code to colon fundament code sequences are code sequences and nucleate acids are colonically useful diagnostic markers and potential therapeutic agents for clinically useful diagnostic markers and potential therapeutic agents for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              30-JAN-2001; 2001WO-US000663.

             The present invention relates to human testis expressed Patched like protein (HTPL, see ABV78752 to ABV78762 and ABB9851) to ABB98520). HTPL has two isoforms, with a few single base pair differences between the two. One of the single base pair changes introduces a premature stop codon in HTPL-S (S for short) compared to HTPL-I (L for long). HTPL shared structural feature organisation with the Patched protein. The shared structural features strongly imply that HTPL plays a role similar to that of Patched, and is a potential tumour suppressor. HTPL is important in regulating male germ cell development, and the HTPL gene was mapped to human chromosome 10p12.1. HTPL and its coding sequence are useful for diagnosing a disorder caused by mutation in HTPL, and in therapy and manufacture of a medicament for treatment or prevention of such disorder sinclude disorders of testis, or adrenal, adult and for the such disorders include disorders of testis, or adrenal, adult and the foothers include disorders of testis, or adrenal, adult and the foothers include disorders of testis, or adrenal, adult and the foothers include disorders of testis, or adrenal, adult and the foothers include disorders of testis, or adrenal, adult and the foothers include disorders of testis, or adrenal, adult and the foothers include disorders of testis, or adrenal, adult and the foothers include disorders of testis, or adrenal, adult and the foothers include disorders of testis, or adrenal, adult and the foothers include disorders of testis, or adrenal and the foothers include testis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; gene therapy; tumour suppressor; HTPL; chromosome 10p12.1; human testis expressed Patched like protein; testis; adrenal; liver; male germ cell development; bone marrow; brain; kidney; lung; placenta; prostate; skeletal muscle; colon; male infertility; cancer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         male infertility
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     03-JAN-2003
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ABV78972

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      skeletal muscle or colon function. clinically useful diagnostic marker male infertility and cancer. The prexample from the invention
The present invention relates to human testis expressed Patched like protein (HTPL, see ABV8759 to ABV78752 and ABB98519 to ABB98520). HTPL has two isoforms, with a few single base pair differences between the two. One of the single base pair changes introduces a premature stop codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL shares an overall structure organisation with the Patched protein. The shared structural features strongly imply that HTPL plays a role similar to that of Patched, and is a potential tumour suppressor. HTPL is important in regulating male germ cell development, and the HTPL gene was mapped to human chromosome 10p12.1. HTPL and its coding sequence are useful for diagnosing a disorder caused by mutation in HTPL, and in therapy and manufacture of a medicament for treatment or prevention of such disorder associated with decreased expression or activity of human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; gene therapy; tumour suppressor; HTPL; chromosome 10p12.1; human testis expressed Patched like protein; testis; adrenal; liver; male germ cell development; bone marrow; brain; kidney; lung; placenta; prostate; skeletal muscle; colon; male infertility; cancer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      07-AUG-2002
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 EP1229046-A2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          03-JAN-2003

```

The present invention relates to human testis expressed Patched like protein (HTPL, see ABV78752 to ABV78762 and ABB98519). HTPL has two isoforms, with a few single base pair differences between the codon in HTPL-8 (S for short) compared to HTPL-1 (t for long). HTPL shares an overall structure organisation with the Patched protein. The shared structural features strongly imply that HTPL plays a role similar to that of Patched, and is a potential tumour suppressor. HTPL is mapped to human chromosome 10p12.1. HTPL and its coding sequence are useful for diagnosing a disorder caused by mutation in HTPL, and in Novel isolated human testis expressed Patched like protein (HTPL), for identifying agonist and antagonist and specific binding partne for treating subjects having defects in HTPL. Example <u>ب</u> Page 109; 718pp; English. partners,)le similar , is useful rs, and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             therapy and manufacture of a medicament for treatment or prevention of such disorder associated with decreased expression or activity of human HTPL. Such disorders include disorders of testis, or adrenal, adult and foetal liver, bone marrow, brain, kidney, lung, placenta, prostate, skeletal muscle or colon function. HTPL proteins and nucleic acids are clinically useful diagnostic markers and potental therapeutic agents for male infertility and cancer. The present oligonucleotide was used in an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; gene therapy; tumour suppressor; HTPL; chromosome 10p12.1; human testis expressed Patched like protein; testis; adrenal; liver; human testis expressed Patched like protein; testis; adrenal; liver; male germ cell development; bone marrow; brain; kidney; lung; placenta; prostate; skeletal muscle; colon; male infertility; cancer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       0
```

The present invention relates to human testis expressed Patched like protein (HTPL, see ABV/8759 to ABV/8762 and ABB98519 to ABB98520). HTPL has two isoforms, with a few single base pair differences between the two. One of the single base pair changes introduces a premature stop codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL shares an overall structure organisation with the Patched protein. The shared structural features strongly imply that HTPL plays a role similar to that of Patched, and is a potential tumour suppressor. HTPL is important in regulating male germ cell development, and the HTPL gene was

The present invention relates to human testis expressed Patched like protein (HTPL, see ABV78759 to ABV18762 and ABB95510). HTPL protein (HTPL, see ABV78759 to ABV18762 and ABB95510 to ABB98520). HTPL has two isoforms, with a few single base pair differences between the two. One of the single base pair changes introduces a premature stop codon in HTPL-8 (S for short) compared to HTPL-L (L for long). HTPL shares an overall structure organisation with the Patched protein. The shares are contact features strongly imply that HTPL plays a role similar

Novel isolated human testis expressed Patched like protein for identifying agonist and antagonist and specific binding for treating subjects having defects in HTPL.

(HTPL), useful gartners, and

HTPL and its coding sequence are useful for diagnosing a disorder caused by mutation in HTPL, and in therapy and manufacture of a medicament for treatment or prevention of such disorder associated with decreased expression or activity of human HTPL. Such disorders include disorders of testis, or adrenal, adult and foetal liver, bone marrow, brain, kidney, lung, placenta, prostate, skeletal muscle or colon function. HTPL proteins and nucleic acids are clinically useful diagnostic markers and potenial therapeutic agents for male infertility and cancer. The present oligonucleotide was used in an

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                to that of Patched, and is a potential tumour suppressor. HTPL is important in regulating male germ cell development, and the HTPL gene wa mapped to human chromosome 10p12.1. HTPL and its coding sequence are useful for diagnosing a disorder caused by mutation in HTPL, and in therapy and manufacture of a medicament for treatment or prevention of such disorder associated with decreased expression or activity of human HTPL. Such disorders include disorders of testis, or adrenal, adult and foetal liver, bone marrow, brain, kidney, lung, placenta, prostate, skeletal muscle or colon function. HTPL proteins and nucleic acids are clinically useful diagnostic markers and potenial therapeutic agents for male infertility and cancer. The present oligonucleotide was used in an example from the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            EP1229046-A2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  prostate;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human HTPL scanning

```

The present invention relates to human testis expressed Patched like protein (HTPL, see ABV78759 to ABV78762 and ABB98519 to ABB98520). HTPL has two isoforms, with a few single base pair differences between the two. One of the single base pair changes introduces a premature stop codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL

The invention relates to a nucleic acid molecule (I) which down regulexpression of an Ets-related gene (ERG). (I) is useful for treating conditions selected from cancer, lymphoma, Ewing's sarcona, melannoma, tumour angiogenesis, diabetic retinopathy, macular degeneration,

regulates

Novel polynucleotide which down regulates expression of Ets-related gen useful for treating cancer, diabetic retinopathy, macular degeneration, arthritis, psoriasis, verruca vulgaris and Sturge Weber syndrome.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       shares an overall structure organisation with the Patched protein. The shared structural features strongly imply that HTPP plays a role similar to that of Patched, and is a potential tumour suppressor. HTPPL is important in regulating male germ cell development, and the HTPL gene was mapped to human chromosome 10pl2.1. HTPL and its coding sequence are useful for diagnosing a disorder caused by mutation in HTPL, and in therapy and manufacture of a medicament for treatment or prevention of such disorder associated with decreased expression or activity of human HTPL. Such disorders include disorders of testis, or adrenal, adult and foetal liver, bone marrow, brain, kidney, lung, placenta, prostate, skeletal muscle or colon function. HTPL proteins and nucleic acids are clinically useful diagnostic markers and potenial therapeutic agents for male infertillty and cancer. The present oligonucleotide was used in an example from the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; hammerhead ribozyme; cytostatic; antitumour; antidiabetic; ophthalmological; antitarthritic; antipsoriatic; virucide; osteopathic; vilnerary; cancer; lymphoma; Ewing's sarcoma; melanoma; psoriasis; tumour angiogenesis; diabetic retinopathy; macular degeneration; neovascular glaucoma; myopic degeneration; arthritis; verruca vulgaris angiofibroma of tuberous sclerosis; port-wine stain; wound healing; sturge Weber syndrome; Kippel-Trenaunay-Weber syndrome; leukaemia; ss;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CC unlgaris, angiofibroma of tuberous sclerosis, port-wine stains, Sturge Weber syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-rendu CC syndrome, leukaemia, osteoporosis and wound healing. (I) is useful for treating a patient having a condition associated with the level of ERG, by contacting cells of the patient with (I) under conditions suitable for the treatment. The method comprises the use of one or more therapies (C under conditions suitable for the treatment in the new of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or cell, by contacting the cell with (I). (I) is useful for cleaving RNA of ERG gene, by contacting (I) with RNA, in the presence of a divelent cation such as Mg2+. (I) is useful for diagnosis of conditions and classes related to the expression of ERG, and as diagnostic tool to examine genetic drift and mutations within diseased cells or to detect the presence of ERG RNA in a cell. (I) is useful for specifically catageting genes that share homology with ERG gene or ERG fusion genes. C LaRK17354-BKC2719 represent nucleic acids, including antisense and conjunction of the invention with the expression of ERG, and cellated PCR primers of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matches

Weber syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-rendu (CC waber syndrome, leukaemia, osteoporosis and wound healing. (I) is useful for treating a patient having a condition associated with the level of ERG, CC by contacting cells of the patient with (I) under conditions suitable for the treatment. The method comprises the use of one or more therapies cunder conditions suitable for the treatment to the patient in conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or constant the cell with (I) (I) is useful for reducing ERG activity in a cell, by contacting the cell with (I), (I) is useful for cleaving RNA of ERG gene, by contacting (I) with RNA, in the presence of a divalent cation such as We2+. (I) is useful for diagnostic fool to cation such as We2+. (I) is useful for diagnostic tool to cation such as We2+. (I) is useful for diagnostic tool to cation such as that share homology with diseased cells or to detect the presence of ERG RNA in a cell. (I) is useful for specifically cargeting genes that share homology with ERG gene or ERG fusion genes.

ABK17354-ABK22719 represent nucleic acids, including antisense and cargeting collect cold molecules which regulate expression of ERG, and collect cold molecules which regulate expression of ERG, and collect cold molecules which regulate expression of ERG, and collect cold molecules which regulate expression of ERG, and collect cold molecules which regulate expression of ERG, and collect cold molecules which regulate expression of ERG, and collect cold molecules which regulate expression of ERG, and collect cold molecules which regulate expression of ERG.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a nucleic acid molecule (I) which down regression of an Ets-related gene (ERG). (I) is useful for treating conditions selected from cancer, lymphoma, Ewing's sarcoma, melanom tumour angiogenesis, diabetic retinopathy, macular degeneration, neovascular glaucoma, myopic degeneration, arthritis, psoriasis, verulgaris, angiofibroma of tuberous sclerosis, port-wine stains, Stu
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   down regulates

(RIBO-) RIBOŻYME PHARM INC (GLAX) GLAXO GROUP LTD.

Novel polymucleotide which down regulates expression of Ets-related gene, useful for treating cancer, diabetic retinopathy, macular degeneration, arthritis, psoriasis, verruca vulgaris and Sturge Weber syndrome.

WPI; 2002-082995/11.

acids (S1, ABB3399), a sequence having 65% sequence identity to (S1), CC (S1) having 95% deviations, especially conservative substitutions or a CC fragment of the sequences comprising at least 8 contiguous amino acids. CC Human POSHL 1 is a proto-oncogene/oncogene product that functions or a CC adaptor protein that interacts with Rho family small GTPases as well as CC downstream components of the signal transduction pathway. (I) is useful CC for identifying a specific binding partner. (I) and nucleic acids (II) cncoding (I) are useful for diagnosing, monitoring disease and treating caused by altered expression of human POSHL1 including diagnosing and CC useful in gene therapy. (II) is useful for constructing microarrays which are useful for measuring and for surveying gene expression and creating CC useful in gene therapy. (II) is useful for constructing microarrays which are useful for measuring and for surveying gene expression and creating cransgenic non-human animals capable of producing the proteins. The CC present sequence is that of a scanning oligonucleotide useful in examples of the invention. Note: The present sequence did not form part of the printed specification, but is based on sequence information supplied to CC Derwent by the European Patent Office

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               domstream components of the signal transduction pathway. (I) is useful for identifying a specific binding partner. (I) and nucleic acids (II) encoding (I) are useful for diagnosing, monitoring disease and treating caused by altered expression of human POSHL1 including diagnosing and treating cancer, they useful in the development of vaccines and (II) is useful in gene therapy. (II) is useful for constructing microarrays which are useful for measuring and for surveying gene expression and creating transgenic non-human animals capable of producing the proteins. The present sequence is that of a scanning oligonucleotide useful in examples of the invention. Note: The present sequence did not form part of the printed specification, but is based on sequence information supplied to Derwent by the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to an isolated SH3 domain (POSH)-like signalling protein 1 (POSHI 1) polypeptide (I), comprising a sequence of 730 amino acids (S1, ABB8399), a sequence having 65% sequence identity to (S1), (S1) having 95% deviations, especially conservative substitutions or a fragment of the sequences comprising at least 8 contiguous amino acids. Human POSHI 1 is a proto-oncogene/oncogene product that functions as an adaptor protein that interacts with Rho family small GTPases as well as downstream components of the signal transduction pathway, (I) is useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel human SH3 domain (POSH)-like signaling protein 1 polypeptide, POSHL-1, useful for treating disorders associated with decreased expression or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 17 BP; 1 A;

Human HLA genotyping oligonucleotide SEQ ID NO 1203.

```
CC Human POSHL 1 is a prote-on-organe/procogene product that functions as an an adaptor protein that interacts with Rho family small GTPsees as well as an CC adaptor protein that interacts with Rho family small GTPsees as well as CC downstream components of the signal transduction pathway. (I) is useful for identifying a specific binding partner. (I) and nucleic acids (II) CC encoding (I) are useful for diagnosing, monitoring disease and treating CC caused by altered expression of human POSHL1 including diagnosing and CC treating cancer, they useful in the development of vaccines and (II) is useful for constructing microarrays which care useful for measuring and for surveying gene expression and creating CC transgenic non-human animals capable of producing the proteins. The CC present sequence is that of a scanning oligonucleotide useful in examples CC present sequence. Note: The present sequence did not form part of the printed specification, but is based on sequence information supplied to CC Derwent by the European Patent Office

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a typing kit for judging human leukocyte antigen (HLA) genotype of a sample by hybridising a substrate on which 10-24 base oligonucle-orides (ABL3012-ABL31809) originating in the sequences of genes e.g. belonging to HLA class I antigens on human genome and containing gene polymorphisms as alloantigens have been immobilised as primers for amplification of cleaved nucleic acids relating to gene polymorphisms. The method is useful for judging HLA genotypes of individuals by determining immunogenetic differences before transplanting between them, providing genetic information to decide compatibility of organ and tissue for transplantation e.g. of bone marrow, kidney, liver, pancreas, Langerhans islet in pancreas and cornea, susceptibility diagnosis of genetic diseases and identifying individuals
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       (NISN )

Enzymatic polynucleotide that down regulates expression of chloride channel calcium activated gene, useful for treating Chronic obstruction pulmonary disease (COPD), chronic bronchitis and asthma. obstructive

Claim 4. English.

The invention relates to enzymatic nucleic acid molecules that down cregulate expression of chloride channel calcium activated 1 (CLCA1) genes by cleaving RNA derived from the genes. The nucleic acid sequences are useful as pharmaceutical agents for treating conditions such as chronic obstructive pulmonary disease (COPD), chronic bronchitis, asthma, cystic fibrosis, obstructive bowel syndrome and any other diseases or conditions that are related to or will respond to the levels of CLCA1 in a cell or tissue. The sequences are useful for reducing CLCA1 activity in a cell, chence, are useful for treatment of a patient having a condition comparises the use of one or more therapies under conditions suitable for the treatment, for example, oxygen therapy, bronchodilators, corticosteroids, antibacterials, vaccinations, acetylcysteine and mucokinetic agents. The cucleic acids of the invention are also used a diagnostic tools to examine genetic drift and mutations within diseased cells or to detect the presence of CLCA1 RNA in a cell. This sequence represents an

The invention relates to a novel pharmaceutical composition, which has a CC first active agent comprising an oligonuclectide antisense to the CC initiation codon, coding region, 5' or 3' end genomic flanking regions, CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of CC junctions of genes encoding a polypeptide associated with lung and/or casal airway dysfunction and a second active agent comprising an CC antiinflammatory steroid and ubiquinone. A composition of the invention CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive, cC immunosuppressive, and cytostatic activity. The composition may have a cuse in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also CC preventing a respiratory, lung or malignant disease or condition, also CC or enhancing the prophylatic or therapeutic respiratory effect of an cantiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of independence or condition. CC lung surfactant in a subject's tissue, or treating bronchoconstriction, CC lung inflammation, lung allergies, or a respiratory disease or condition. CC condition, but was obtained in electronic format directly from WIPO cC at fip.wipo.int/pub/published_pct_sequences corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or Disclosure; ubiquinone SEQ ID NO 10475; 872pp; English

The invention relates to enzymatic nucleic acid molecules that down cregulate expression of chloride channel calcium activated 1 (CLCA1) genes by cleaving RNA derived from the genes. The nucleic acid sequences are useful as pharmaceutical agents for treating conditions such as chronic obstructive pulmonary disease (CODP), chronic bronchitis, asthma, cystic fibrosis, obstructive bowel syndrome and any other diseases or conditions that are related to or will respond to the levels of CLCA1 in a cell or tissue. The sequences are useful for reducing CLCA1 activity in a cell, chence, are useful for treatment of a patient having a condition comparises the use of one or more therapies under conditions suitable for the treatment, for example, oxygen therapy, bronchoilators, corticosteroids, antibacterials, vaccinations, acetylcysteine and mucokinetic agents. The concleic acids of the invention are also used as diagnostic tools to candine genetic drift and mutations within diseased cells or to detect the presence of CLCA1 RNA in a cell. This sequence represents an activation of the invention contribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           G-cleaver; amberzyme; cancer; REI-A activity; breast cancer; human; lung cancer; prostate cancer; colorectal cancer; prain cancer; coesophageal cancer; stomach cancer; bladder cancer; pancreatic cancer; cervical cancer; head and neck cancer; ovarian cancer; melanoma; lymphoma; glioma; multidrug resistant cancer; REI-A-specific inhibitor; chemotherapy; paclitaxel; docetaxel; cisplatin; methotrexate; cyclophosphamide; doxorubin; fluorouracil carboplatin; edatrexate; gencitabine; radiation therapy; inflammatory disease; asthma; diabetes; rheumatoid arthritis; restenosis; Croin's disease; obesity; ischaemia; gene therapy; autoimmune disease; lupus; multiple sclerosis; sepsis; transplant/graft rejection; reperfusion injury; glomerulonephritis; allergic airway inflammation; inflammatory bowel disease; infection; se
The invention describes an enzymatic nucleic acid molecule (I) which do regulates expression of a sequence encoding a subunit of nuclear factor kappa B (NFKB), where (I) is an inozyme, zinzyme, G-cleaver or amberzym configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-(I) is useful for cleaving RNA common and account the level of REL-(I) is useful for cleaving RNA common account to the level of REL-(I) is useful for cleaving RNA common account to the level of REL-(I) is useful for cleaving RNA common account to the level of REL-(II) is useful for cleaving RNA common account to the level of REL-(II) is useful for cleaving RNA common account to the level of REL-(II) is useful for cleaving RNA common account to the level of REL-(III) is useful for cleaving RNA common account to the level of REL-(III) is useful for cleaving RNA common account to the level of REL-(III) is useful for cleaving RNA common account to the level of REL-(III) is useful for cleaving RNA common account to the level of REL-(III) is useful for cleaving RNA common account to the level of REL-(III) is useful for cleaving RNA common account to the level of REL-(III) is useful for cleaving RNA common account to the level of REL-(III) is useful for cleaving RNA common account to the level of REL-(III) is useful for cleaving RNA common account to the level of REL-(III) is useful for cleaving RNA common account to the level of REL-(III) is useful for cleaving RNA common account to the level of REL-(III) is useful for cleaving RNA common account to the level of REL-(III) is useful for cleaving RNA common account to the level of REL-(IIII) is useful for cleaving RNA common account to the level of REL-(III) is useful for cleaving RNA common account to the level of REL-(III) is useful for cleaving RNA common account to the level of REL-(IIII) is useful for cleaving RNA common account to the level 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          chips. The nucleic acid sequences of the invention can be used in gene therapy. This polynucleotide sequence represents a tumour suppression related human fukutin oligonucleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     NFKB sub-unit modulating inozyme substrate #479.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             03-JUN-2003
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ACA06660
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ACA06660 standard;

CC the presence of a divalent cation, especially Mg^2^+. The enzymatic and cantisense nucleic acid molecules are useful for treating breast, lung, coryctate, colorectal, brain, oesophageal, stomach, bladder, pancreatic, cervical, head and neck, ovarian cancer, melanoma, lymphoma, gliuma or cultidrug resistant cancer. The method involves use of other drug conterapies such as monoclonal antibodies, REL-A-specific inhibitors or contemporary including paclitaxel, docetaxel, cisplatin, methotrexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate, cyclophosphamide, doxorubin, fractional carboplatin, edatrexate, cyclophosphamide, doxorubin, treating inflammatory disease such as rheumatoid arthritis, restencess, treating inflammatory disease such as crepiction, gene therapy applications, ischaemia/reperfusion injury consist, allergic airway inflammation, inflammatory bowel disease or infection. This sequence represents the substrate of a novel enzymatic
                                                        nucleic acid molecule

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      CC kappa B (NPKB), where (1) is an inozyme, zinzyme, g-cleaver or amberzyme according to the configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating RBL-A activity in a cell, for treating a patient having a condition associated with the level of RBL-A. C(1) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially Mg^2+. The enzymatic and cantisense nucleic acid molecules are useful for treating breast, lung, coryotate, colorectal, brain, oseophageal, stomach, bladder, pancreatic, coryotal, head and neck, overian cancer, melanoma, lymphoma, glioma or cultidrug resistant cancer. The method involves use of other drug therapies such as monoclonal antibodies, REL-A-specific inhibitors or chemotherapy including paclitexel, docetaxel, cisplatin, methotrexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate, cyclophosphamide, doxorubin, framcreating inflammatory disease such as rheumatoid arthritis, restenosis, asthma, Crohn's disease, diabetes, comentable are also useful for treating inflammatory disease such as rheumatoid arthritis, restenosis, asthma, Crohn's disease, diabetes, comental nervous system (CNS) and myocardial), glomerulonephritis, cepscition. This sequence represents the substrate of a novel enzymatic conficeic acid molecule
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Connect and is useful for down-regulating REL-A activity in a cell, for CC treating a patient having a condition associated with the level of REL-A. CC (I) is useful for cleaving RNA comprising a sequence of REL-A gene, in CC the presence of a divalent cation, especially Mg^2+. The enzymatic and antisense nucleic acid molecules are useful for treating breast, lung, CC prostate, colorectal, brain, ossophageal, stomach, bladder, pancreatic, CC cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or cmiltidrug resistant cancer. The method involves use of other drug therapies such as monoclonal antibodies, REL-A-specific inhibitors or CC chemotherapy including paclitaxel, docetaxel, ciaplatin, methotrexate, Cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate, Cyclophosphamide, contrations, contrations, contrations, disease, diabetes, Cyclophosphamide, contrations, ischaemia/reperfusion injury Cyclophosphamide, contrations, ischaemia/reperfusion injury Cyclophosphamide, contration, inflammatory bowel disease of infection. This sequence represents the substrate of a novel enzymatic cyclophosphamide, contratic end and contratic end and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to novel human zinc finger-containing CC proteins and their coding sequences: MDZ3, MDZ4, MDZ7, MDZ12. MDZ3 is ccoded at chromosome 7q22.1, MDZ4 is encoded at chromosome 6p21.3-22.2, CC MDZ7 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome 1fp11.2 and MDZ12 is encoded in therapy. Cr is encoded at chromosome 1fp11.2 and MDZ12 is encoded at chromosome 2fp11.2 and MDZ12 sequences are useful in therapy. Cr associated with decreased or increased expression or activity of MDZ3, CC MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic 2fp11.2 acids and proteins are also useful for diagnosing or monitoring a disease 2fp11.2 acids can also be used as probes to detect and characterize gross 2fp11.2 acids can also be used as probes to detect and characterize gross 2fp11.2 acids can also be used as probes to detect and characterize gross 2fp11.2 acids can also be used as probes to detect and characterize gross 2fp11.2 acids can also be used as probes to detect and characterize gross 2fp11.2 acids can also be used as probes to detect and characterize gross 2fp11.2 acids can also be used as probes to detect and characterize gross 2fp11.2 acids can also be used as probes to detect and characterize gross 2fp11.2 acids can acids and proteins are useful as therapeutic agents for gene therapy or as 2fp11.2 acids can acids and proteins are useful as therapeutic agents for gene therapy or as 2fp11.2 acids can acids and the proteins are useful as therapeutic agents for gene therapy or as 2fp11.2 acids acids and the proteins are useful as therapeutic agents for gene therapy or as 2fp11.2 acids acids and the proteins are useful as therapeutic agents for gene therapeutic acids aci
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

The present invention relates to novel human zinc finger-containing CC proteins and their coding sequences: MDZ3, MDZ4, MDZ7, MDZ12. MDZ3 is cenoded at chromosome 7922.1, MDZ4 is encoded at chromosome 6p21.3-32.2, CC MDZ7 is encoded at chromosome 1fp11.2 and MDZ12 is encoded at chromosome (1sq26.1. The MDZ3, MDZ4, MDZ7, and MDZ12 sequences are useful in therapy, CO rin manufacturing a medicament for treating or preventing a disorder CC associated with decreased or increased expression or activity of MDZ3, CC MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic CC acids and proteins are also useful for diagnosing or monitoring a disease CC caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic CC acids can also be used as probes to detect and characterize gross CC alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are Useful in constructing microarrays for measuring gene expression. The CC proteins are useful as therapeutic agents for gene therapy or as CC vaccines. The present sequence was used to illustrate the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       proteins and their coding sequences: MDZ3, MDZ4, MDZ12. MDZ3 is encoded at chromosome 7q22.1, MDZ4 is encoded at chromosome 6p21.3-22.2, MDZ7 is encoded at chromosome 15q12.1 and MDZ12 is encoded at chromosome 15q26.1. The MDZ3, MDZ4, MDZ7, and MDZ12 sequences are useful in therapy, or in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic acids and proteins are also useful for diagnosing or monitoring a disease caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic acids can also be used as probes to detect and characterize gross alterations in MDZ3, MDZ4, MDZ7, or MDZ12. The probes are useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as the proteins are useful as therapeutic agents for gene therapy or as
                                                                                                                                    WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Cytostatic; immunostimulant; gene therapy; vaccine; human; zinc finger protein; MDZ3; MDZ4; MDZ7; MDZ12; chromosome 7q22.1; chromosome 6p21.3-22.2; chromosome 16p11.2; chromosome 15q26.1; cancer; developmental disorder; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ4, MDZ7 or MDZ12, e.g. cancer.
New zinc finger-containing proteins and nucleic acids, useful in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ4, MDZ7 or MDZ12, e.g. cancer.
                                                                                                                                                                                                                                                                                                   02-AUG-2001; 2001US-00922181.
                                                                                                                                                                                                                                                                                                                                                      30-JUL-2002;
                                                                                                                                                                                                                                                                                                                                                                                                         05-FEB-2003
                                                                                                                                                                                                                                                                                                                                                                                                                                                           EP1281758-A2

                                                  encoded at chromosome 7q22.1, MDZ4 is encoded at chromosome 6p21.3-22.2, MDZ4, is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome 15q26.1. The MDZ3, MDZ4, MDZ7, and MDZ12 sequences are useful in therapy, or in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic acids and proteins are also useful for diagnosing or monitoring a disease caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic acids can also be used as probes to detect and characterize gross alterations in MDZ4, MDZ7, or MDZ12 genetic locus. The probes are useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as vaccines. The present sequence was used to illustrate the invention.

New zinc finger-containing proteins and nucleic acids, useful in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ4, MDZ7 or MDZ12, e.g. cancer. MDZ3,

Example 8; SEQ ID NO 239; 103pp; English.

The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MDZ3, MDZ4, MDZ7, MDZ12. MDZ3 is encoded at chromosome 7g22.1, MDZ4 is encoded at chromosome 6p21.3-22.2, MDZ7 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome 15g26.1. The MDZ3, MDZ4, MDZ7, and MDZ12 sequences are useful in therapy, or in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic acids and proteins are also useful for diagnosing or monitoring a disease caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic

The present invention relates to novel hum proteins and their coding sequences: MDZ3,

human zinc finger-containing DZ3, MDZ4, MDZ7, MDZ12. MDZ3

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  នួននួននួន
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               밁
                                                      The present invention relates to novel human zinc finger-containing correcting and their coding sequences: MDZ3, MDZ4, MDZ7, MDZ12. MDZ3 is encoded at chromosome 7q22.1, MDZ4 is encoded at chromosome 6p21.3-22.2, MDZ7 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome 16p26.1. The MDZ3, MDZ4, MDZ7, and MDZ12 sequences are useful in therapy. Or in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic caids and proteins are also useful for diagnosing or monitoring a disease CC caids and proteins are spression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic acids can also be used as probes to detect and characterize gross alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as vaccines. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   RESULT 1085
                        The present invention relates to novel human zinc finger-containing correcting and their coding sequences: MD23, MD24, MD27, MD212. MD23 is encoded at chromosome 7922.1, MD24 is encoded at chromosome 6921.3-22.2, CC encoded at chromosome 7722.1, MD24 is encoded at chromosome 6921.3-22.2, CC MD27 is encoded at chromosome 16p11.2 and MD212 is encoded at chromosome (1926.1. The MD23, MD24, MD27, and WD212 sequences are useful in therapy, CC or in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MD23, CC MD24, MD27, or MD212, e.g. cancer or developmental disorders. The nucleic caused by altered expression of MD23, MD24, MD27, or MD212. The nucleic caused by altered expression of MD23, MD24, MD27, or MD212. The nucleic acids can also be used as probes to detect and characterize gross calterations in MD23, MD24, MD27, or MD212. The probes are useful in constructing microcarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as C vaccines. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Matches
                                                                                                                                                                                                                                                                                                                                                New zinc finger-containing proteins and nucleic acids, useful manufacturing a medicament for treating or preventing a disorgassociated with decreased or increased expression or activity MDZ4, MDZ7 or MDZ12, e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Cytostatic; immunostimulant; gene therapy; vaccine; human; zinc finger protein; MDZ3; MDZ4; MDZ7; MDZ12; chromosome 7: chromosome 6p21.3-22.2; chromosome 16p11.2; chromosome 15q developmental disorder; ss.

MDZ3 is encoded at chromosome 7q22.1, MDZ4 is encoded at chromosome 5p21.3-22.2, MDZ7 is encoded at chromosome 1pp1.2 and MDZ12 is encoded at chromosome 1pp1.2 and MDZ12 is encoded at chromosome 15q26.1. The MDZ3, MDZ4, MDZ7, and MDZ12 sequences are useful in therapy, or in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic acids and proteins are also useful for diagnosing or monitoring a disease caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic acids can also be used as probes to detect and characterize gross alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as vaccines. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           zinc finger protein;
chromosome 6p21.3-22.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Cytostatic;

New zinc finger-containing proteins and nucleic acids, useful in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ4, MDZ7 or MDZ12, e.g. cancer. MDZ3,

Example 8; SEQ ID NO 4547; 103pp; English.

CC proteins and their coding sequences; MDZ3, MDZ4, MDZ7, NDZ12. MDZ3 is CC proteins and their coding sequences; MDZ3, MDZ4, MDZ7, NDZ12. MDZ3 is CC encoded at chromosome 7g22.1, MDZ4 is encoded at chromosome 6p21.3-22.2, CC MDZ7 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome 6p21.3-22.2, CC MDZ7 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome CC or in manufacturing a medicament for treating or preventing a disorder CC associated with decreased or increased expression or activity of MDZ3, CC MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic CC acids and proteins are also useful for diagnosing or monitoring a disease CC caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic CC acids can also be used as probes to detect and characterize gross CC alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are CC useful in constructing microsarrays for measuring gene expression. The CC proteins are useful as therapeutic agents for gene therapy or as CC vaccines. The present sequence was used to illustrate the invention.

The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ59389 - ABZ62216, ABZ64544 - ABZ65531, ABZ66520 - ABZ66524, ABZ65530 - ABZ66585 represent substrate/target sequences for the human riboxymens of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel short interfering RNA and enzymatic nucleic acid useful for treating cancer, modulates the expression of a nucleic acid encoding HER2, K-Ras, H-Ras, N-Ras, and human deficiency virus sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Mcswiggen

```

The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ59389 - ABZ62216, ABZ64544 - ABZ65531, ABZ66520 - ABZ66524, ABZ66530 - ABZ66585 represent substrate/target sequences for the human in ABZ66530 - ABZ66585 represent substrate/target sequences for the human ribozymes of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ59889 - ABZ62216, ABZ64544 - ABZ65531, ABZ66520 - ABZ66585, represent substrate/target sequences for the human ABZ66530 - ABZ66585 represent substrate/target sequences for the human
The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ra human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rhemmatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder; or pancreatic cancer, and HIV infection, and AIDS. The sequence shown in ABZ59889 - ABZ62216, ABZ64544 - ABZ65531, ABZ66520 - ABZ66524.

ribozymes
                    acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ59889 - ABZ62216, ABZ64544 - ABZ6531, ABZ66520 - ABZ66524, ABZ66530 - ABZ66585 represent substrate/target sequences for the human ribozymes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; ribozyme; short interfering RNA; siRNA; HER2; K-Ras; enzymatic nucleic acid; H-Ras; N-Ras; HIV; cytostatic; anti-HIV; anti-rheumatic; cancer; AIDS; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 17 BP; 2
                                                                                                                                                                                                                Novel short interfering RNA and enzymatic nucleic acid useful for treating cancer, modulates the expression of a nucleic acid encoding HER2, K-Ras, H-Ras, N-Ras, and human deficiency virus sequences.
                                                                                                                                                                                                                                                                                                                                                29-MAY-2001; 2001US-0294140P.

XX

The invention relates to a n

CC acid molecule or an enzymatic

CC expression of a nucleic acid

CC acid molecule of the inventic

CC also useful for treating brance

CC also useful for treating brance

CC also useful for treating brance

CC also useful for treating cance

CC shown in ABZ5989 - ABZ6216

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; ribozyme; short interfering RNA; siRNA; HER2; K-Ras; enzymatic nucleic acid; H-Ras; N-Ras; HIV; cytostatic; antianti-rheumatic; cancer; AIDS; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                  acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, blunder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ59889 - ABZ62216, ABZ64544 - ABZ65531, ABZ66520 - ABZ66524, ABZ66530 - ABZ66585 represent substrate/target sequences for the human ribozymes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel short interfering RNA and enzymatic nucleic acid useful for treating cancer, modulates the expression of a nucleic acid encoding HER2, K-Ras, H-Ras, N-Ras, and human deficiency virus sequences.

The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or CC Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense can enzymet nucleic acids such as hammerhead ribozymes, DNAzymes, conzymes, and G-cleaver ribozymes. Also disclosed cranscriptase and/or HBV reverse transcriptase primer sequences, as well cranscriptase and/or HBV reverse transcriptase primer sequences, as well cas oligonucleotides that specifically bind the Enhancer I region of HBV CC DNA. The nucleic acids may be used to modulate the expression of HBV CC compounds and/or potential therapies directed against HBV, and compounds contact modulate the expression and/or replication of HBV and compounds of the invention are useful for the treatment of degenerative and CC disease states related to HBV and HCV infection, replication and gene capression such as cirrhosis, liver failure, and hepatocellular carcinoma. The present sequence represents a substrate for one of the HCV incention.

The present invention relates to nucleic acid molecules which modulate CC the synthesis, expression and/or stability of Hepatitis C virus (HCV) or CC Hepatitis B virus (HEV) NNA. The nucleic acid molecules include antisense CC and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes, clinzymes, amberzymes, and G-cleaver ribozymes. Also disclosed are nucleic acid decoy molecules and aptamers that bind to HBV reverse CC are nucleic acid decoy molecules and aptamers that bind to HBV reverse CC as oligonucleotides that specifically bind the Enhancer I region of HBV CC DNA. The nucleic acids may be used to modulate the expression of HBV CC DNA. The nucleic acids may be used to modulate the expression of HBV CC cappounds and/or potential therapies directed against HBV, and compounds CC compounds and/or potential therapies directed against HBV, and compounds CC methods of the invention are useful for the treatment of degenerative and CC disease states related to HBV and HCV infection, replication and gene expression such as cirrhosis, liver failure, and hepatocellular carcinoma. The present sequence represents a substrate for one of the HCV
                                                                                                                                                                                                                                                                                                                                                                              Blatt L, F

The present invention rethe synthesis, expression the synthesis, expression Hepatitis B virus (HBV) and enzymatic nucleic acinozymes, zinzymes, amber

vention relates to nucleic acid molecules which modulate expression and/or stability of Hepatitis C virus (HCV) c expression and nucleic acid molecules include antiser rus (HBV) RNA. The nucleic acid molecules include antiser nucleic acids such as hammerhead ribozymes, DNAzymes,

hammerhead G-cleaver 1

DNAzymes, Also disclosed

antisense

8

Novel compound useful for hepatocellular carcinoma,

treating cirrhosis, liver failure, or condition associated with hepatitis C

virus

```

are nucleic acid decoy molecules and aptamers that bind to HBV reverse transcriptase and/or HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV DNA. The nucleic acids may be used to modulate the expression of HBV genes and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or replication of HCV. The compounds and methods of the invention are useful for the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene expression such as cirrhosis, liver failure, and hepatocellular carcinoma. The present sequence represents a substrate for one of the HCV DNAzyme or minus strand DNAzyme sequences disclosed in the present

Novel compound whepatocellular of infection. useful for treating cirrhosis, liver failure, carcinoma, or condition associated with hepatitis C virus

Claim 1; Page 251; 387pp; English

The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or CC Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes, CC inozymes, ainzymes, amberzymes, and G-cleaver ribozymes. Also disclosed are nucleic acid decoy molecules and aptamers that bind to HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV CC DNA. The nucleic acids may be used to modulate the expression of HBV CC genes and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or replication of HCV. The compounds and disease states related to HBV and HCV infection, replication and gene capression such as cirrhosis, liver failure, and hepatocellular carounds the present sequence represents a substrate for one of the HCV invention or minus strand DNAzyme sequences disclosed in the present

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to nucleic acid molecules which modulate CC the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HEV) RNA. The nucleic acid molecules include antisense and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes, CC inozymes, zinzymes, amberzymes, and G-cleaver ribozymes. Also disclosed are nucleic acid decoy molecules and aptamers that bind to HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV CC DNA. The nucleic acids may be used to modulate the expression of HBV compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and methods of the invention are useful for the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene expression such as cirrhosis, liver failure, and hepatocellular carrier or minus strand DNAzyme sequences disclosed in the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches

                                                                                                                                                                                                                                                                                                                                                  The present invention relates to nucleic acid molecules which modulate CC the synthesis, expression and/or stability of Hepatitis C virus (HCV) or CC Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense CC and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes, CC inozymes, zinzymes, amberzymes, and G-cleaver ribozymes. Also disclosed are nucleic acid decoy molecules and aptamers that bind to HBV reverse CC transcriptase and/or HBV reverse transcriptase primer sequences, as well CC as oligonucleotides that specifically bind the Enhancer I region of HBV CC DNA. The nucleic acids may be used to modulate the expression of HBV CC genes and HBV viral replication. Also disclosed is a method for screening CC compounds and/or potential therapies directed against HBV, and compounds CC that modulate the expression and/or replication of HCV. The compounds and CC disease states related to HBV and HCV infection, replication and gene CC expression such as cirrhosis, liver failure, and hepatocellular carcinoma. The present sequence represents a substrate for one of the HCV invention or minus strand DNAzyme sequences disclosed in the present
                                                                                                                                                                                                                                                                  Best Loc

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to murine oligonucleotides (ACC62754-ACC68806), which are associated with tumour suppression, tumour reversion, apoptosis and virus resistance. The oligonucleotides are useful as (1) as probes and primers for detecting, identifying, quantifying and/or amplifying nucleic acid, e.g. as one component of a gene chip, in vitro as (anti)sense reagents; and (2) for production of recombinant polypeptides. The oligonucleotides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.

```
Determining allelic DNA sequences and haplotypes in a DNA sample, comprises using primers with a single difference corresponding to a polymorphic site combined with quantitative PCR using a fluorescent readout.
  Example 1;
  Page

36pp; English.
```

The present sequence is that of primer A6, which is one of a set of primers (see ACC84057-62) used in an example of the method of the CC invention, i.e. differential amplification of polymorphisms (DAP), to CC distinguish 4 templates that differed at a single position. A 475 bp CC portion of the human P450 gene CYP2D6 was amplified using primer A1 CC (forward) and A5 (reverse) and cloned into a TA cloning vector. 3 PCR CC primers (A2-A4) identical to A1 except for a single difference at their CC 3, terminal bases were used with A5 to re-amplify the CYP2D6 fragment, CC generating the point mutations A, C and T at nucleotide 3380 (G is CC present in the most common allele). The 3 amplicons were cloned into TA CC cloning vector. In order to examine the effect of amplicon size, an CC additional reverse primer, A6, was used to generate a 57 bp amplicon. DAP CC was performed and was able to distinguish between the 4 templates. The CC method combines allele-specific PCR with technology used for quantitative CC PCR. It can be used to score the presence or absence of particular CC polymorphisms or particular haplotypes in a DNA sample

                                                                                                                                                                        superior to unmodified error-correcting polymerases in amplifying genomic DNA from low copy number templates. The enzymes tested were Pfu DNA polymerase and Pfs, a fusion of 8807d to the C-terminus of Pfu. Pfs was found to require 1/4 to 1/10 as many units as Pfu for efficient amplification. The invention provides a method of detecting polymorphisms, e.g. single nucleotide polymorphisms, by amplification and error correction using polymerases improved by the addition of a sequence -non-specific nucleic acid-binding domain that enhances the ability of the enzyme to bind and catalytically modify the nucleic acid

useful e.g. polypeptide New nucleic acid encoding human for treatment of tun and antibodies. tumors prostate membrane-specific antigen, mors and viral infection, also related

Disclosure; Page 130; 771pp; French.

The invention relates to the isolation of 6327 nucleotide sequences, fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 80% identity, after optimal alignment, with the nucleotides, a sequence that hybridizes under stringent conditions with the nucleotides. Or the complement, or corresponding RNA, of the nucleotides. The nucleotides are used as probes or primers for detecting, identifying quantifying and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tumour suppression or reversion, apoptosis and or viral resistance, to produce recombinant polypeptides, and to prepare transgenic animals, as experimental models. The nucleotides (also vectors containing them and cells containing the vectors), the encoded polypeptides and antibodies (Ab) against the polypeptide are useful for prevention and/or treatment of viral infections or diseases characterized by development of tumours

```
or cell degeneration (e.g. Alzheimer's disease or schizophrenia). Analysis of the expression of the nucleotides can be used for diagnos and/or prognosis of these diseases. The nucleotides and polypeptides also be used to screen for their specific interactive molecules, potentially useful for treating diseases associated with abnormal expression of the nucleotides.
                                                                                                                                                                                                     diagnosis

New human sodium-hydrogen exchanger like protein 1 (NHELP1), useful as passive replacement therapy or as a vaccine for treating or preventing disorders associated with aberrant expression or activity of human NHELP1. ρJ

Example 2 SEQ ID NO 741; 468pp; English.

RESULT 1104
ADC04254/c
ID ADC0425
XX ADC0425 The invention relates to a nucleic acid molecule which encodes a Na+/H+ exchanger like protein (NHELP1). The NHELP1 nucleic acid molecule, NHELP1 polypeptide, an antibody against the protein or its antigen-binding fragment is useful in therapy. The NHELP1 nucleic acid molecule, NHELP1 polypeptide and an agonist are particularly useful for manufacturing a medicament for treating or preventing a disorder associated with decreased expression or activity of human NHELP1. The antibody or its antigen-binding fragment, and an antagonist, are useful for manufacturing a medicament for treating or preventing a disorder associated with increased expression or activity of human NHELP1. The NHELP1 nucleic acid or protein is useful as passive replacement therapy, as a vaccine, or in diagnostic methods. This sequence corresponds to a 17-mer oligonucleotide spanning the sequence of the human NHELP1 gene (ADC03514).

                                                                                                                                                                                                                                                                                                           The present invention describes a method of determining whether an individual is predisposed to susceptibility to low bone mineral density (EMD) and/or bone damage comprising identifying whether the individual has at least one polymorphism in a polymucleotide encoding a protein, where the polymorphism in a polymucleotide encoding a protein, see ADC98235 to ADC98315). An agent identified in an method from the present invention which can be used for the prevention or treatment of a disease resulting in susceptibility to low BMD and/or bone damage is useful in the manufacture of a medicament for use in modulating the susceptibility to low BMD and/or bone damage is osteoporosis. The present pCR primer sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Determining whether an individual is predisposed to susceptibility to bone mineral density (BMD) and/or bone damage, involves identifying polymorphisms in associated genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      low bone mineral density; BMD; k single nucleotide polymorphism;
